COMMENTS:

Test Name	In Range	Out Of Range	Reference Range	Lab
COCCIDIOIDES AB (IGG), IMMUNODIFFUSION, SERUM	NEGATIVE			

REFERENCE RANGE: NEGATIVE

INTERPRETIVE CRITERIA:

- NEGATIVE: Antibody Not Detected
- POSITIVE: Antibody Detected

The immunodiffusion (ID) procedure correlates both in sensitivity and clinical utility with the CF test. The ID test, which detects IgG directed to the "F" antigen, becomes positive within 4 weeks after infection and remains positive throughout clinically active disease. It is most useful in confirming the specificity of low CF titers, where lines of identity are formed with reference antisera. Positive ID reactions are diagnostic for coccidioidomycosis and usually indicate active or recent disease and remain detectable for up to 1 year thereafter.
