Anti-liver/kidney microsomal antibodies (Anti-LKM-1) were previously tested by indirect immunofluorescence (IF) using rodent liver/kidney substrate. Identification of a specific antibody target as cytochrome P450 IID6 has led to the current recombinant based ELISA. Antibodies to this cytochrome are present in approximately 70% of patients with autoimmune hepatitis type 2. This antibody is also present in approximately 10% of patients with hepatitis C infection.
