

Patient Information	Specimen Information	Client Information

COMMENTS:

Test Name	In Range	Out Of Range	Reference Range	Lab
D-DIMER, QUANTITATIVE	0.47		<0.50 mcg/mL FEU	

Elevated D-dimer levels are associated with DIC, malignancies, inflammation, sepsis, surgery, trauma, and pregnancy. A D-dimer result less than 0.5 mcg/mL FEU, in conjunction with a non-high clinical pre-test probability assessment model, excludes deep vein thrombosis and pulmonary embolism. However, since D-dimer values increase with age, the American College of Physicians recommends an age-adjusted cut-off value in patients older than 50. The calculation for an age adjusted cut-off value is age (years) x 0.01 mcg/mL FEU. For example, the cut-off for a 70-year-old patient would be 70 x 0.01 mcg/mL FEU.
